Security Engineering Hiring Team
Scale AI

Your posting describes detections as software — version control, peer review, measurable performance. That's exactly how I've operated for the last several years, just across a wider set of platforms than most detection engineers ever touch.

At Trend Micro/Cysiv, I built a Python-based orchestration framework spanning nine SIEM and EDR platforms — Sentinel, Defender, Google SecOps, Splunk, CrowdStrike, SentinelOne, Sumo Logic, XSIAM, and Devo — with reusable per-technology adapters, API-level token/role management, and multithreaded parallel deployment, all running through a full GitLab CI/CD pipeline with automated tests and staged rollout before anything hit production. Underneath that sits telemetry engineering for 220+ log sources and a Common Information Model standardizing schema across all of it — the same mechanics behind mature, low-noise detection at scale.

I currently support Treasury's SOC directly against live incidents, and I build detection content informed by threat intel rather than reacting to it after the fact — pulling CTI to tune rule logic and enrich alerts for faster triage. I've also shipped production GenAI tooling for false-positive triage and automated rule generation, the same class of AI-powered tooling this role is chartered to build and scale.

I'd welcome the chance to talk through how that combination of platform-scale detection engineering, telemetry pipeline ownership, and incident response experience fits Scale AI's security engineering team.
