Security Hiring Team

Anthropic

Building the detections and playbooks that let a team catch what matters fast, and layering AI onto that work to catch it faster, is exactly the shape of my last decade in security engineering.

I currently direct sprint priorities and technical direction for the detection and alerting content a Treasury SOC runs its incident response against. Earlier, at Trend Micro/Cysiv, I architected a Python-based orchestration framework managing detection-rule lifecycle across nine SIEM and EDR platforms via their native APIs — including API-level token/role/permission management and multithreaded parallel deployment inside a full GitLab CI/CD pipeline — on top of which I created and maintain 2,300+ detection rules covering most of the MITRE ATT&CK matrix.

I've also built production GenAI tooling that triages false positives, generates detection content, and converts rules between SIEM syntaxes automatically — the same direction of using LLMs to enhance detection, investigation, and response that this role is built to lead.

I'd welcome the chance to talk through how that combination of incident response leadership, multi-platform detection engineering, and LLM-driven tooling fits Anthropic's Detection & Response work.
