Security Engineer — Cloud IAM, Identity Governance & Security Tooling (AWS/GCP)

Security engineer with 10+ years of hands-on cloud security work across AWS, GCP, and Azure — including direct IAM policy and access-control implementation in both AWS and GCP, and building the API tokens, roles, and permissions layer for a nine-platform security orchestration framework. Builds scrappy internal tooling in Python and evaluates vendor/third-party integration security as a matter of course.

CORE SKILLS

Cloud IAM & Identity Governance: Hands-on IAM policy and access-control implementation in AWS and GCP; created and managed API tokens, roles, and permissions across nine SIEM/EDR platforms as the identity/access layer of a cross-platform orchestration framework — real API-level access-management work

Cloud Security & Architecture: AWS, GCP, Azure; threat assessment and security-control evaluation across a wide range of vendor platforms; securing third-party API integrations across nine distinct vendor ecosystems

Tooling & Automation: Python-based internal tooling and scripting for security automation; full CI/CD pipeline (GitLab) for tooling delivery; reusable per-vendor API adapters covering rule management, schemas, and platform objects

Detection & Data Engineering: MITRE ATT&CK-aligned detection content, multi-source data pipeline engineering (220+ sources), GCP Dataproc/BigQuery/Dataflow

PROFESSIONAL EXPERIENCE

Senior Security Engineer — Shorepoint

Oct 2023 – Present

- Treasury SOC (TSSOC), Threat & Research team — own the detection and alerting content a live SOC runs incident response against.
- DOE/NNSA Security Data Integration (completed): built a new security data platform integrating three distinct vendor telemetry sources (CrowdStrike, Suricata, Zeek) into Elasticsearch, including the data-quality monitoring and alerting layer on top.
- CISA CDM at DOE (completed): data ingestion and quality work across a combined Elasticsearch and Splunk environment.

Senior Threat Detection Engineer & Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of the detection engineering/data science team building signature, behavioral, statistical, time-series, and ML-based detection content against cloud-scale customer data.

Threat Detection Engineer & Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Implemented IAM policies and access controls in both AWS and GCP environments as part of ongoing cloud security engineering work.
- Architected a Python-based orchestration framework spanning nine SIEM/EDR platforms — Microsoft Sentinel, Microsoft Defender, Google SecOps (Chronicle), Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, and Devo — via each platform's native API, including reusable per-vendor adapters and the API tokens/roles/permissions layer needed to secure each third-party integration.
- Delivered the framework through a full GitLab CI/CD pipeline, with multithreading to manage concurrent operations across many customers and vendor platforms in parallel.
- Evaluated security tooling and controls from this same wide range of vendors as part of ongoing threat assessment and security-posture work.
- Used GCP Dataproc compute clusters, Spark/PySpark, and Apache Beam/GCP Dataflow for large-scale exploratory data analysis and historical data retrieval.

Security Data Scientist — Experian

Jan 2015 – Jan 2018

- Built DNS-based detection and mitigation for malware infections; analyzed large-scale security log data to surface anomalous behavior.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Cloud Architecture, Tooling and Security (CATS) Team
Netflix

Identity and access management at real scale is a tooling and data problem before it's a policy problem — which is exactly the lens I've built my career around, securing access across heterogeneous cloud and vendor ecosystems.

At Trend Micro/Cysiv, I implemented IAM policies and access controls directly in both AWS and GCP, and architected a Python-based orchestration framework spanning nine distinct SIEM/EDR platforms — building the API tokens, roles, and permissions layer needed to securely integrate each one via its native API. That meant designing secure access patterns for nine separate third-party integrations, each with its own authentication model, and building reusable adapters and scrappy internal tooling in Python to manage all of them at once.

That framework ran through a full GitLab CI/CD pipeline, with multithreading to handle concurrent operations across many customers and vendor platforms in parallel — the same kind of self-serve, foundational tooling that a paved-path GCP/AWS access program depends on. I also evaluated security controls and tooling across this same wide vendor landscape as part of ongoing threat-assessment work.

I'd welcome the chance to talk through how that hands-on IAM and cross-platform access-management background fits the CATS team's roadmap.
