Security Hiring Team

OpenAI

Spotting the anomaly that matters inside a sea of normal behavior — and proving it out fast — is the core skill I've built a career on, and it's the same instinct insider-risk investigations depend on.

At Trend Micro/Cysiv, I investigated anomalous entity behavior at scale for threat hunting and incident support: authentication-attempt anomalies by country and volume, parent/child process chains, and Outlook process-chain analysis — the same class of behavioral analytics that surfaces access abuse and unusual data movement. I built that analysis on top of a Python-based detection-as-code framework I architected across nine SIEM/EDR platforms, and created 2,300+ detection rules covering most of the MITRE ATT&CK matrix.

I've also shipped production GenAI tooling for security automation — prompt engineering for triage and automated detection-content generation — cutting the manual work out of investigations, which is exactly the kind of AI-assisted leverage this role is chartered to bring to insider-threat work.

I'd welcome the chance to talk through how that combination of entity-behavior investigation, detection engineering, and AI-driven tooling fits OpenAI's insider-threat program.
