Incident Command Hiring Team

Uber

Getting to root cause fast, under pressure, with incomplete information is the daily reality of detection engineering work — and it's the same instinct this role is built around at a much larger scale.

I currently direct sprint priorities and technical direction for the detection and alerting content a Treasury SOC runs its incident response against, and built the entity-behavior analytics layer (UEBA) on top of a from-scratch security data platform for DOE/NNSA — purpose-built for proactive threat hunting. Earlier, at Trend Micro/Cysiv, I investigated anomalous entity behavior at scale for threat hunting and incident support: authentication anomalies by country and volume, parent/child process chains, and Outlook process-chain analysis, on top of 2,300+ detection rules I created and managed covering most of the MITRE ATT&CK matrix.

I've also built production GenAI tooling for security automation — prompt engineering for triage and automated detection-rule generation — the same class of AI-assisted investigation and response tooling this role is chartered to mature.

I'd welcome the chance to talk through how that combination of deep technical investigation, MITRE ATT&CK-aligned detection engineering, and AI-driven tooling fits Uber's incident response program.
