Vulnerability Management Hiring Team
Uber

Turning raw vulnerability scan data into detection content teams can actually act on is work I've been doing for years — and I'd love to bring that same data-engineering lens to Uber's Vulnerability Management Platform.

At Forescout, I evaluated vulnerability exposure and security controls across production environments, ingesting Tenable vulnerability scan data into analytics platforms and building detection content directly on top of it. At Trend Micro/Cysiv, I architected a Python-based orchestration framework spanning nine SIEM/EDR platforms via native APIs, with multithreading to deploy detection content across many customers in parallel inside a full GitLab CI/CD pipeline — the same shift-left, automate-everything mindset this role calls for.

I've also built production GenAI tooling for security automation — prompt engineering for triage and automated rule generation — and have hands-on IAM implementation experience in both AWS and GCP. I currently direct sprint priorities and technical direction for the Treasury SOC's detection team.

I'd welcome the chance to talk through how that combination of vulnerability data engineering, multi-platform orchestration, and AI-driven automation fits the RBVM roadmap.
