Security Engineering Hiring Team
Airbnb

Securing the infrastructure and data platforms that everything else runs on is quieter work than detection and response, but it's the same discipline: understand the system, find the gap, build the control that closes it without getting in engineers' way.

At Trend Micro/Cysiv, I built a Python-based orchestration framework managing detection-rule lifecycle across nine SIEM and EDR platforms via their native APIs — which meant creating and managing API tokens, roles, and permissions across every one of those platforms, real hands-on identity and access-management work at the API level. I've implemented IAM policies and roles directly in both AWS and GCP, and built production GenAI tooling that automates triage and detection-content generation, cutting manual effort out of security operations.

Today at Shorepoint, I direct the technical priorities for the detection and alerting content a live SOC runs its incident response against, and earlier built an entire security data platform from scratch for DOE/NNSA — ingesting CrowdStrike, Suricata, and Zeek telemetry into Elasticsearch and layering data-quality monitoring and access governance on top. I'd welcome the chance to bring that same builder-and-partner instinct to Airbnb's Cloud & Data Security team.
