Senior Security Engineer — Detection Engineering, Multi-SIEM Orchestration & Incident Response

Detection and incident-response engineer with 12 years of experience building the detection platforms, rules engines, and automated pipelines that find and resolve real security incidents at scale. Early hire at a next-gen cloud SIEM startup (Cysiv, spun out of Trend Micro, later acquired by Forescout) where I built the detection rules engine from scratch and created/managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix. Built a central Elasticsearch cyber-defense platform from the ground up for a federal cloud-security program, and currently support live incident/case response for a federal SOC. Run a multi-SIEM detection-as-code CI/CD pipeline across nine platforms with automated testing, staged/safe rollout, and formally tracked detection-quality metrics — the same discipline this role's mandate to modernize threat detection and incident response at scale calls for.

CORE SKILLS

Detection Engineering & Incident Response: 2,300+ detection rules covering most of the MITRE ATT&CK matrix (signature, statistical, behavioral, ML); current incident/case response for a federal SOC (Treasury); formal rule-quality metrics (coverage, precision/false-positive rate) with staged/safe rollout before production

Cloud Security Platform Engineering: Built an entire cyber-defense/detection platform from the ground up on Elasticsearch — CrowdStrike (EDR), Suricata, and Zeek telemetry ingestion, UEBA detection layer on custom data transforms, data-quality monitoring/alerting — for a DOE/NNSA cloud-adjacent security program

Multi-SIEM Detection-as-Code & Orchestration: Rule/content orchestration via native APIs across Microsoft Sentinel, Microsoft Defender, Google SecOps (Chronicle), Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, Devo, ArcSight; GitLab CI/CD with automated unit/integration tests and multithreaded parallel rule deployment across many tenants

AI/ML Applied to Security: Prompt engineering to analyze security data, identify false positives, and generate new detection content; GenAI-driven SIEM API orchestration; reusable GenAI tooling to automate detection-rule translation between SIEM syntaxes — direct experience applying AI/ML to accelerate detection and response

Cloud & IAM: Hands-on IAM policy/role implementation in AWS and GCP; API-level token/role/permission management across nine SIEM platforms; GCP Dataproc/BigQuery/Dataflow, PySpark; Azure Sentinel/Defender API orchestration

Engineering: Python, SQL, Git, GitLab CI/CD, Docker

PROFESSIONAL EXPERIENCE

Senior Cybersecurity Engineer — Shorepoint

Oct 2023 – Present

- Currently create and manage detection/alerting analytics directly supporting a federal SOC's live incident response and case work, tuning content for accuracy and coverage (Treasury SOC / TSSOC, current project).
- Built an entirely new cyber-defense platform from the ground up — CrowdStrike (EDR), Suricata, and Zeek telemetry into a central Elasticsearch environment — including a UEBA detection layer, custom Kibana dashboards, and data-quality monitoring/alerting content (DOE/NNSA Security Data Integration project, completed).
- Supported data ingestion and data-quality efforts within an Elasticsearch/Splunk environment for a federal continuous-monitoring program, resolving systemic data-quality root causes (CISA CDM at DOE, completed).

Senior Threat Detection Engineer and Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of a data science and detection engineering team building signature, behavioral, statistical, and ML-based detection content against massive-scale customer telemetry on a cloud-based big-data platform, incorporating threat intel from Forescout's in-house Vedere Labs research team to tune detection logic and reduce false positives.

Threat Detection Engineer and Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Very early hire at a next-gen cloud SIEM startup — built the detection rules engine from scratch and created/managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix, plus 50+ data filters, against 220+ ingested log sources.
- Owned exploratory data analysis at scale (GCP Dataproc, PySpark/SparkSQL) to develop new detection content and built a Common Information Model standardizing fields across all parsed data feeding the detection layer — the kind of systemic-root-cause and standards work this role's cross-organizational remediation mandate calls for.

Security Data Scientist — Experian

Jan 2015 – Jan 2018

- Analyzed large-scale security log data to build custom detection models — DNS-based malware detection/mitigation and anomalous-behavior discovery across the network.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Hiring Team

Google — GCP Cyber Defense Center

I'm a detection and incident-response engineer who has spent 12 years building the rules engines, cloud detection platforms, and automation pipelines that find and resolve real security incidents at scale — and I'm based in the Dallas/Ft. Worth area and ready to relocate to Sunnyvale to do this work on-site.

As a very early hire at Cysiv (a next-gen cloud SIEM startup that spun out of Trend Micro, later acquired by Forescout), I built the detection rules engine from scratch and created and managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix — signature, statistical, behavioral, and ML-based content, tuned against massive-scale customer telemetry. I've also built an entire cyber-defense platform from the ground up for a DOE/NNSA cloud-security program — ingesting CrowdStrike endpoint EDR, Suricata, and Zeek telemetry into Elasticsearch, then layering UEBA detection and data-quality alerting on top — and I currently support live incident and case response for a federal SOC, work that maps directly onto GCDC's mandate to rapidly triage, resolve, and systemically remediate critical security issues.

I run a multi-SIEM detection-as-code CI/CD pipeline in GitLab across nine platforms — Microsoft Sentinel, Microsoft Defender, Google SecOps, CrowdStrike, SentinelOne, and more — with automated testing, staged/safe rollout, and formally tracked detection-quality metrics before anything reaches production. I've also applied GenAI directly to detection engineering: prompt-driven false-positive triage, new rule generation, and automated rule translation between SIEM syntaxes — directly relevant to GCDC's push to pioneer AI/ML capabilities that accelerate threat detection and automate response ahead of the next wave of AI-driven attacks.

I'd welcome the chance to talk through how this background applies to modernizing Google Cloud's threat detection and incident response capabilities.
