Senior Threat Detection Engineer — SIEM/EDR/NDR, MITRE ATT&CK & Incident Response

Threat detection engineer with 12 years of experience writing detection logic against multi-source security logs, correlating alerts across SIEM/EDR/NDR platforms, and tuning content to cut false positives. Early hire at a next-gen cloud SIEM startup (Cysiv, spun out of Trend Micro, later acquired by Forescout) where I built the detection rules engine from scratch and created/managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix. Currently write and manage Splunk detection/alerting analytics for a federal SOC's incident response and case work. Run a multi-SIEM detection-as-code CI/CD pipeline across nine platforms — Splunk, Microsoft Sentinel, Google SecOps, CrowdStrike, SentinelOne, and more — with formally tracked precision/false-positive-rate metrics and staged rollout before production.

CORE SKILLS

Threat Detection & MITRE ATT&CK: 2,300+ detection rules covering most of the MITRE ATT&CK matrix (signature, statistical, behavioral, aggregation/threshold, ML-based); attack-vector and TTP-aware detection-logic design; formal coverage/precision/false-positive-rate tracking with staged/safe rollout

SIEM / EDR / NDR / SOAR: Splunk (current, live SOC alerting/analytics); Elasticsearch/Elastic Security (native ES detection rules, Query DSL, transforms); CrowdStrike and SentinelOne (EDR) rule/content orchestration; Suricata and Zeek (NDR) telemetry ingestion and detection content; SOAR-style automated multi-SIEM rule deployment

Log Correlation & Multi-Source Analysis: Correlation across network, endpoint, cloud, and SaaS log sources; time-series anomaly detection on authentication and process-chain behaviors; Common Information Model standardizing fields across 220+ log sources

Multi-SIEM Detection-as-Code & Orchestration: Rule/content orchestration via native APIs across Microsoft Sentinel, Microsoft Defender, Google SecOps (Chronicle), Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, Devo, ArcSight; GitLab CI/CD with automated tests and multithreaded parallel deployment

Threat Intel Integration: Uses CTI (indicators, TTPs, actor/campaign context) to tune detection logic and validate true- vs. false-positive activity; enriched alerts/cases with threat intel (Forescout's Vedere Labs) to speed investigation

Engineering: Python, SQL, Git, GitLab CI/CD, GCP Dataproc/BigQuery/Dataflow

PROFESSIONAL EXPERIENCE

Senior Cybersecurity Engineer — Shorepoint

Oct 2023 – Present

- Currently write and manage Splunk detection/alerting analytics (saved searches) that serve directly as a federal SOC's detection and alerting content, tuning for accuracy and coverage against real incidents and cases (Treasury SOC / TSSOC, current project).
- Built an entirely new detection platform from the ground up — CrowdStrike (EDR), Suricata, and Zeek (NDR) telemetry into a central Elasticsearch environment — including a UEBA detection layer, custom Kibana dashboards, and data-quality monitoring/alerting content (DOE/NNSA Security Data Integration project, completed).
- Supported data ingestion and data-quality efforts within an Elasticsearch/Splunk environment for a federal continuous-monitoring program (CISA CDM at DOE, completed).

Senior Threat Detection Engineer and Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of a data science and threat detection engineering team building signature, behavioral, statistical, and ML-based detection content against massive-scale customer log data, incorporating threat intel from Forescout's in-house Vedere Labs research team to tune detection logic and cut false positives.

Threat Detection Engineer and Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Very early hire at a next-gen cloud SIEM startup — built the detection rules engine from scratch and created/managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix, plus 50+ data filters, against 220+ ingested log sources.
- Built time-series anomaly detection for entity behaviors — authentication attempts by country/volume, parent/child process chains.

Security Data Scientist — Experian

Jan 2015 – Jan 2018

- Analyzed large-scale security log data to build custom detection models — DNS-based malware detection/mitigation and anomalous-behavior discovery across the network.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Hiring Team

Salesforce — Threat Detection

I'm a threat detection engineer who has spent 12 years writing the detection logic and correlation queries that catch real attacks against network, endpoint, and cloud infrastructure — and I'd like to bring that background to Salesforce's Threat Detection team.

As a very early hire at Cysiv (a next-gen cloud SIEM startup that spun out of Trend Micro, later acquired by Forescout), I built the detection rules engine from scratch and created and managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix — signature, statistical, behavioral, and ML-based content, written and tuned against massive-scale customer log data across network, endpoint, and cloud sources. I currently write and manage Splunk detection/alerting analytics that serve directly as a federal SOC's detection content, and I've built native detection rules directly in Elasticsearch/Elastic Security — work that maps closely onto writing logic on security platforms to detect malicious activity and refining alert reliability with the incident response team.

I run a multi-SIEM detection-as-code CI/CD pipeline in GitLab across nine platforms — Splunk, Microsoft Sentinel, Google SecOps, CrowdStrike, SentinelOne, and more — with formally tracked precision and false-positive-rate metrics, and I use threat intel directly to validate whether an alert reflects real adversary activity during triage and false-positive analysis. I'd welcome the chance to bring that same rigor to detecting attacks against Salesforce's infrastructure, products, employees, and customers.
