Security, Detection & Response Team
HubSpot

Building detection foundations and response systems that scale with an organization — rather than growing headcount to match alert volume — is the exact model I've run for the last 11 years, most recently supporting live incident response for a federal SOC.

At Trend Micro/Cysiv, I built automated detection systems and orchestration across nine SIEM and EDR platforms, including CrowdStrike, through their native APIs, delivered via a full GitLab CI/CD pipeline, and created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix. I paired that with GenAI-powered automation for false-positive triage and detection-content generation, giving the team leverage without proportional headcount growth — the same automated-detection scaling model this role centers on.

Currently at Shorepoint, I own the detection and alerting content that Treasury's SOC runs live incident response against, and I previously built an entire security data platform for DOE/NNSA from raw log ingestion (CrowdStrike, Suricata, Zeek) through a full UEBA detection layer — correlating telemetry across cloud, identity, and endpoint sources to catch post-entry behavior, not just individual signatures.

I'd welcome the chance to talk through how that detection-and-response background fits HubSpot's roadmap.
