Security, Detection & Response Hiring Team
HubSpot

Building detection foundations that hold up under real incident response — not just passing a demo — is the standard I've worked to for the past decade across federal and commercial SOC's alike.

At Trend Micro/Cysiv, I built detection-as-code orchestration across nine SIEM and EDR platforms, including CrowdStrike, through their native APIs, delivered through a full GitLab CI/CD pipeline, and created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix. I paired that with GenAI-powered automation for false-positive triage and cross-platform rule conversion — the same detection-in-depth, automation-first approach this role is built around.

Currently at Shorepoint, I own the Splunk-based detection and alerting content Treasury's SOC runs incident response against day to day, correlating telemetry across identity, cloud, and endpoint sources to support live case investigations. Earlier, at DOE/NNSA, I built an entire security data platform from raw ingestion through a full UEBA detection layer, including the large-scale logging infrastructure underneath it.

I'd welcome the chance to talk through how that detection engineering and incident-response background fits HubSpot's security roadmap.
