Detection Engineering Hiring Team
Instacart

Treating detection like a software discipline — versioned, tested, and deployed through repeatable pipelines rather than ad hoc rule-writing — is the exact model I've built my career around.

At Trend Micro/Cysiv, I built detection-as-code orchestration across nine SIEM and EDR platforms, including CrowdStrike and SentinelOne, through their native APIs, run entirely through a GitLab CI/CD pipeline — version control, peer review, automated testing, and deployment for every rule. I created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix across a complex, multi-source environment, and built the telemetry pipelines for 220+ log sources that fed them.

Currently at Shorepoint, I own the detection and alerting content Treasury's SOC runs live incident response against, and earlier at DOE/NNSA I built an entire security data platform — from raw CrowdStrike, Suricata, and Zeek ingestion through a full UEBA detection layer. That combination of detection-as-code discipline, multi-cloud/EDR telemetry, and hands-on Python automation maps directly to how Instacart's Detection Engineering team operates.

I'd welcome the chance to talk through how that background fits the team's detection coverage roadmap.
