Detection Engineering Team
Instacart

A detection-as-code mindset — everything versioned, tested, and deployed through repeatable pipelines — is exactly how I've built detection engineering programs for the last several years, and it's the model I'd bring to Instacart's Detection Engineering team.

At Trend Micro/Cysiv, I built and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix, delivered through a full CI/CD pipeline in GitLab so every rule was versioned, peer-reviewed, and tested before it shipped — no hand-edited console rules. I paired that with data engineering across 220+ log sources spanning cloud, endpoint, and SaaS telemetry, the same kind of multi-source coverage problem your team owns across endpoint, cloud, container, and SaaS.

Currently at Shorepoint, I own the detection and alerting content that Treasury's SOC runs live incident response against, and I previously built an entire security data platform for DOE/NNSA — ingesting CrowdStrike, Suricata, and Zeek log data through to a full UEBA detection layer. I've also built GenAI-powered automation for triage and rule generation, which maps directly onto reducing analyst toil through automation and SOAR-style workflows.

I'd welcome the chance to talk through how that detection-as-code background fits the team's coverage priorities.
