Detection Engineering Team
Keeper Security

Turning security telemetry into operational value — reducing noise, tuning signal quality, and mapping coverage against MITRE ATT&CK — is the core of what I've built across the last several SIEM detection engineering roles.

At Trend Micro/Cysiv, I built detection-as-code orchestration across nine SIEM and EDR platforms, including CrowdStrike and SentinelOne, through their native APIs, and created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix — all delivered through a full GitLab CI/CD pipeline so every rule was version-controlled and tested. I also built the log parsing and normalization layer myself: 50+ Logstash filters and a Common Information Model standardizing field names and types across every parsed data source, which is the same telemetry-quality problem your Senior Detection Engineer role centers on.

Currently at Shorepoint, I own the Splunk-based detection and alerting content Treasury's SOC runs incident response against day to day, and I hold a Splunk User Certification along with certification in Splunk for Analytics and Data Science. I've also built GenAI-powered automation for false-positive triage and cross-platform rule conversion — the kind of signal-quality improvement your team is scaling.

I'd welcome the chance to talk through how that SIEM and telemetry background fits Keeper's detection maturity roadmap.
