Detection Response Team

Vercel

Building the detections and visibility that let a security team act fast and stay ahead of anomalies — not just react to them — is the core discipline I've practiced across the last several SIEM-heavy detection engineering roles.

At Trend Micro/Cysiv, I built and ran SIEM detection-as-code across nine platforms, including CrowdStrike and SentinelOne, delivered through a full GitLab CI/CD pipeline, and created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix. I used SQL and Python daily for security data analysis and investigation, and I've built GenAI-powered automation to strengthen detection coverage without adding headcount — the same enhance-and-scale approach this role calls for.

Currently at Shorepoint, I own the Splunk-based detection and alerting content that drives Treasury's SOC incident response, and I previously built an entire security data platform for DOE/NNSA — from raw log ingestion through a full UEBA detection layer. That end-to-end ownership, from visibility gaps to shipped detections to incident response, is exactly the loop this role runs.

I'd welcome the chance to talk through how that detection and SIEM background fits Vercel's Detection Response team.
