Senior Data Engineer — Pipelines, Data Modeling & Team Leadership

Data engineer with 8 years building and operating high-volume data pipelines and source-of-truth data platforms at scale — 220+ ingestion sources, cloud-based big-data processing, and a standardized data model built from the ground up. Directs sprint priorities as a team lead and has architected and owned data infrastructure end to end, from ingestion through modeling to the dashboards stakeholders rely on.

CORE SKILLS

Data Pipeline Engineering: Built and operated ingestion pipelines for 220+ unique data sources; 50+ Logstash filters for parsing/normalization; Apache Beam / GCP Dataflow for historical and cold-storage data retrieval; PySpark / GCP Dataproc / BigQuery for large-scale distributed processing; GCP serverless/event-driven enrichment pipelines

Data Modeling & Source-of-Truth Design: Designed and built a Common Information Model (CIM) — a company-wide data dictionary standardizing field names and types across 220+ heterogeneous data sources — the same discipline a source-of-truth data-mart program requires: one consistent, trustworthy schema stakeholders can build on

Dashboarding, SQL & Stakeholder-Facing Data: SQL for data manipulation and analysis; built custom Kibana dashboards and visualizations directly on top of modeled data for stakeholder consumption; Python for automation and data tooling; comfortable presenting data-driven findings to both technical and non-technical audiences

Team Leadership: Team lead directing sprint priorities for a live SOC's detection and alerting content backlog, balancing new build work against incident-driven demands; built formal quality metrics and staged/safe-rollout practices for production deployments; mentors and elevates less experienced teammates

PROFESSIONAL EXPERIENCE

Senior Security Engineer — Shorepoint

Oct 2023 – Present

- Treasury SOC (TSSOC), Threat & Research team — team lead directing sprint priorities for the team's content backlog, balancing new build work against incident-driven priorities.
- DOE/NNSA Security Data Integration (completed): built a new data platform from scratch — ingestion, data transforms, and data-quality monitoring/alerting — a ground-up build owned end to end, not an inherited program.

Senior Threat Detection Engineer & Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of the data science and engineering team building analytics content against massive customer data sets using cloud-based big-data tooling.

Threat Detection Engineer & Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Built the data engineering layer for 220+ unique data sources as an early hire at a startup: 50+ Logstash filters for parsing/normalization, multiple log-collection agent deployments, and a Common Information Model standardizing field names/types across every source — the single source of truth the rest of the platform was built on.
- Used GCP Dataproc compute clusters, Zeppelin notebooks, and a home-grown reusable analysis toolkit for exploratory data analysis at scale; wrote Spark jobs (PySpark/SparkSQL) to load and analyze data from cloud storage buckets.
- Built a home-grown Apache Beam program run via GCP Dataflow to fetch large volumes of historical cold-storage data for customers on request.
- Built custom dashboards and visualizations directly on top of modeled data for both internal and customer-facing use; tracked data-quality metrics and used staged rollout before full production deployment of new pipeline changes.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Enterprise Data & AI Hiring Team
HackerOne

A source of truth is only as good as the discipline behind it — one consistent schema everyone can trust, built to scale as new sources get added. That's the exact problem I solved as an early hire at a fast-growing security startup: I built the data engineering layer for 220+ unique data sources from scratch, including a Common Information Model that standardized field names and types across every one of them, so the rest of the platform had one trustworthy foundation to build on.

That same ground-up ownership shows up throughout my background: cloud-based big-data pipelines (GCP Dataproc, PySpark, Apache Beam/Dataflow) for large-scale processing and historical data retrieval, custom dashboards built directly on modeled data for stakeholder consumption, and — on my current team — directing sprint priorities as team lead for a live SOC's technical backlog, balancing new build work against incident-driven demands in a fast-moving, early-stage-style environment.

I'm drawn to HackerOne's mission of democratizing a single source of truth across a growing organization, and I'd welcome the chance to bring that same rigor around data modeling, pipeline ownership, and cross-team collaboration to the DataOne team.
