Detection & Response Hiring Team
North

Closing the gap between detection and resolution takes both engineering rigor and a willingness to put AI to work where it genuinely reduces toil. I've built exactly that combination: a detection-as-code pipeline spanning nine SIEM platforms with version control, automated testing, and staged rollout, alongside production GenAI tooling that automates false-positive triage and detection-rule generation for a live SOC.

That build includes 2,300+ detection rules mapped to the MITRE ATT&CK matrix, native-API detection authoring across Splunk, Microsoft Sentinel, CrowdStrike, and Google SecOps, and Python automation orchestrating deployment across every platform in parallel. On my current team, I support incident investigation and response for a live Treasury SOC, using threat intelligence to tune detections and speed root-cause analysis — applying good judgment on when AI-assisted findings need human validation before acting on them.

I'd welcome the chance to bring that detection engineering, AI-enabled SOC, and automation experience to North's Detection and Response team.
