Cyber Security Hiring Team
Rackspace Technology

Standing up a new observability and vulnerability management team means proving the tooling actually works — that telemetry is complete, controls are tuned, and coverage is measurable — before it means anything else. That's the exact work I've done as a founding engineer building a next-gen SIEM from scratch and later architecting a detection-as-code orchestration framework across nine SIEM and EDR platforms, with automated testing, staged rollout, and formal coverage and false-positive-rate tracking built in from day one.

That build includes native-API detection and tooling ownership across Splunk, Microsoft Sentinel, CrowdStrike, SentinelOne, Elasticsearch, and Google SecOps, plus vulnerability data engineering — ingesting Tenable scan data into analytics platforms and building exposure-analysis content on top of it, rather than just administering the scanner. I've directed delivery in a technical team-lead and sprint-lead capacity throughout, driving the testing and rollout discipline a new security tooling team needs to earn trust fast.

I'd welcome the chance to bring that security tooling, detection engineering, and vulnerability management depth to Rackspace's new observability and vulnerability management team.
