Threat Detection Engineer — SaaS/Identity Threat Detection, SIEM/XDR, Large-Scale Security Data Analysis

Threat detection engineer and security data scientist with 11 years turning terabytes of security telemetry into accurate, low-noise detection content. Founding-engineer experience building a next-gen SIEM's rules engine and data pipelines from scratch, plus a nine-platform detection-as-code orchestration framework across Splunk, Microsoft Sentinel, and Google SecOps (Chronicle). Deep hands-on background in identity/auth anomaly detection, false-positive reduction, and correlating signals across dozens of disparate log sources — the same core discipline SaaS/identity threat detection demands.

CORE SKILLS

Threat Detection & SIEM/XDR Engineering: Native-API detection content authoring, tuning, and false-positive-rate tracking across Splunk, Microsoft Sentinel, Google SecOps (Chronicle), CrowdStrike, SentinelOne, Elasticsearch, Sumo Logic, Palo Alto XSIAM, and Devo; created/managed 2,300+ detection rules spanning the MITRE ATT&CK matrix

Identity & Behavioral Anomaly Detection: Time-series anomaly detection of authentication behaviors (auth attempts by country, anomalous volume/attempt patterns) and process-chain behaviors; unsupervised ML for device/entity clustering; SQL-based querying and correlation of security events across large event volumes

Large-Scale Security Data Analysis: GCP Dataproc/PySpark/SparkSQL exploratory data analysis at scale; data engineering and correlation across 220+ heterogeneous log sources via a purpose-built Common Information Model; GenAI-assisted triage and detection-content generation for reducing false positives

Data Engineering, APIs & Automation: Reusable per-platform API adapters for ingesting and correlating security telemetry across SIEM/XDR platforms; Python automation; GitLab CI/CD for detection-as-code; AWS/GCP/Azure security telemetry

PROFESSIONAL EXPERIENCE

Senior Security Engineer — Shorepoint

Oct 2023 – Present

- Treasury SOC (TSSOC), Threat & Research team — builds and maintains Splunk-based detection/alerting content used directly for incident investigation, tuning content to cut false positives while preserving detection coverage.
- DOE/NNSA Security Data Integration (completed): built an Elasticsearch-based detection platform from scratch, including UEBA (behavioral anomaly) detection logic and data-quality monitoring/alerting across multiple ingested log sources.

Senior Threat Detection Engineer & Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of the detection engineering team building signature, statistical, behavioral, and ML-based detection content against massive customer telemetry, with a continuous focus on reducing false-positive rates without sacrificing true-positive coverage.

Threat Detection Engineer & Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Founding engineer: built data engineering/pipelining for 220+ unique log sources into a next-gen cloud SIEM, correlating signals across sources via a homegrown Common Information Model (standardized data dictionary) — the same integration/correlation discipline SaaS threat detection across many app APIs requires.
- Created and managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix, plus 50+ data filters; architected a Python-based detection-as-code orchestration framework across nine SIEM/EDR platforms with automated testing and false-positive-rate tracking built in.
- Time-series anomaly detection of identity and entity behaviors: authentication attempts by country over time, anomalous auth volume/attempt detection, and process-chain (parent/child) behavioral analysis — direct precedent for identity-based SaaS threat detection.
- Exploratory data analysis at scale using GCP Dataproc, PySpark/SparkSQL, and Zeppelin notebooks; built a homegrown reusable analysis toolkit for investigating large volumes of security event data.

Security Data Scientist — Experian

Jan 2015 – Jan 2018

- Analyzed large security datasets to build custom detection models for emerging threats, including DNS-based malware detection and anomalous-behavior discovery across network log data.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Hiring Team

Reco

Detecting identity-based threats across a sprawling set of SaaS applications is fundamentally a data correlation and false-positive-reduction problem — the exact discipline I've spent 11 years on. As a founding engineer at Cysiv (later acquired by Trend Micro/Forescout), I built the data pipelines and detection rules engine for a next-gen cloud SIEM from scratch: 220+ heterogeneous log sources correlated through a homegrown Common Information Model, and 2,300+ detection rules across the MITRE ATT&CK matrix, all built with false-positive-rate tracking as a first-class requirement rather than an afterthought.

That same correlation discipline extends directly to identity: I've built time-series anomaly detection for authentication behaviors — auth attempts by country over time, anomalous volume/attempt patterns — the same shape of problem as flagging OAuth risk or identity-provider misconfigurations in a SaaS environment. I later architected a detection-as-code orchestration framework spanning nine SIEM/XDR platforms, including Microsoft Sentinel and Google SecOps (Chronicle), with automated testing and staged rollout built into every deployment.

I'd welcome the opportunity to bring that large-scale security data analysis and detection engineering background to Reco's threat detection team.
