AI Research Team
Cribl

I've spent real, hands-on time creating and managing Cribl pipelines directly — not adjacent tooling, but Cribl's own observability/data-routing product, the exact system Cribl's AI/ML work is built to extend and orchestrate. That direct product fluency, paired with 12 years training and evaluating ML models against security data, is what draws me to this role.

At Trend Micro/Cysiv, I trained and evaluated unsupervised ML models for network device clustering and built time-series anomaly-detection models for entity behavior — production ML running against cloud-scale customer data on GCP Dataproc (PySpark/SparkSQL). I also built and shipped GenAI-powered tooling: prompt-engineered workflows that let detection engineers query SIEM APIs directly and convert detection rules between SIEM syntaxes automatically — reusable "skills" that turned language-model output into daily production tooling rather than a one-off demo.

My M.S. in Physics gave me a strong numerical-modeling foundation that I've applied through clustering, time-series, and PyTorch/scikit-learn work across every security data platform I've touched since — most recently building the full ingestion-to-detection analytics layer, including Elasticsearch transforms and UEBA content, for a DOE/NNSA security data platform.

I'd welcome the chance to talk through how that Cribl-pipeline fluency and applied ML background could support Cribl's AI Research team.
