Information Security Team

Cribl

I've built and managed Cribl pipelines directly — hands-on, real experience with the exact product your security stack runs on, not just adjacent data-engineering work. Combined with 12 years of detection engineering and SOC incident response, I'd bring both a user's fluency with Cribl and the security operations depth this Staff role needs.

At Trend Micro/Cysiv, I built a next-gen SIEM's rules engine from the ground up, creating and managing 2,300+ detection rules covering most of the MITRE ATT&CK matrix, then extended that into a Python-based detection-as-code framework orchestrating rule deployment across nine SIEM and EDR platforms — Microsoft Sentinel, Microsoft Defender, Google SecOps, Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, and Devo — via native APIs, with multithreaded parallel deployment, full GitLab CI/CD, automated testing, and staged rollout tracked against coverage and false-positive metrics. I've also integrated threat intelligence directly into that detection logic, using indicators and TTPs from commercial feeds, OSINT, and in-house research to tune rules and enrich alerts for faster triage.

More recently, at DOE/NNSA I built a security data platform from scratch — ingesting CrowdStrike, Suricata, and Zeek into Elasticsearch and layering a UEBA detection capability, dashboards, and data-quality monitoring on top — and I currently lead the detection and alerting content a live Treasury SOC runs its incident investigations against as part of its Threat & Research team. That combination of building the data pipeline, writing the detection logic, and supporting the incident response that follows is exactly the loop this role owns.

I'd welcome the chance to talk through how this background fits the Staff Security Operations Engineer role.
