Detection & Response Hiring Team
Roblox

Roblox's Detection & Response team needs someone who can design custom security data pipelines, build detection strategies that keep false positives low, and lead real-time incident response — not adjacent skills, but the exact work I've been doing across Experian, DOE/NNSA, Treasury's SOC, and Trend Micro/Cysiv over a 12-year security career.

At Trend Micro/Cysiv, I built ETL data pipelines end to end for 220+ log sources — PySpark and SparkSQL analysis on GCP Dataproc, a homegrown Apache Beam program on GCP Dataflow for historical retrieval, and a Common Information Model standardizing schema across everything ingested — the same shape of work your team needs to keep Roblox's security data pipeline systems running at scale. On top of that data foundation, I built a Python-based detection-as-code orchestration framework spanning nine SIEM and EDR platforms, including CrowdStrike and SentinelOne, with multithreaded parallel deployment, full CI/CD, automated testing, and staged rollout — and created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix while actively tracking false-positive rates.

More recently, at DOE/NNSA I built a security data platform from scratch — ingesting CrowdStrike, Suricata, and Zeek into a new Elasticsearch environment and layering UEBA detection, dashboards, and data-quality monitoring on top — and I currently support Treasury's SOC directly against live incidents as a Threat & Research team lead, building the detection and alerting content investigators run against every day. I'd bring that same combination of pipeline engineering, multi-platform detection ownership, and hands-on incident response to Roblox's mission of keeping its community and enterprise safe.

I'd welcome the chance to talk through how this experience maps to the Principal Detection and Response Engineer role.
