Hiring Team

Abnormal Security

I've spent the last several years operating inside the kind of regulated, high-scrutiny environments Abnormal Gov needs to keep FedRAMP-compliant — with active Top Secret (Treasury), DOE Q, and Public Trust (DOE) clearances earned through direct work on federal security programs, not just adjacent exposure to them.

At Shorepoint, I've worked three sequential federal security engagements that map directly onto this role's scope. I currently create and manage the detection and alerting analytics (Splunk saved searches) that support Treasury's Security Operations Center through live incident response and case work — the same logging-and-monitoring-pipeline ownership this role calls for. Before that, I built DOE/NNSA's entire Security Data Integration platform from scratch: ingesting CrowdStrike, Suricata, and Zeek telemetry into a new Elasticsearch environment, then layering UEBA detection, data-quality monitoring and alerting, and custom dashboards on top of it. And prior to that, I supported data ingestion and data-quality efforts for DOE's Continuous Diagnostics and Mitigation (CDM) program in an Elasticsearch/Splunk environment — the same continuous-monitoring discipline FedRAMP's ConMon requirements are built around.

Beyond the federal-environment specifics, I've built and run a multi-SIEM detection-as-code CI/CD pipeline in GitLab — orchestrating rule and content deployment across Splunk, Microsoft Sentinel, Microsoft Defender, Google SecOps, CrowdStrike, SentinelOne, and more via their native APIs, with automated testing, staged/safe rollout, and rule-quality metrics tracked before anything reaches production. That includes hands-on creation and governance of API tokens, roles, and permissions across those platforms — the same access-management discipline this role's RBAC and account-provisioning responsibilities require — plus Cloud IAM policy work in both AWS and GCP.

I'd welcome the chance to talk through how that background applies to keeping Abnormal Gov's environment secure, resilient, and audit-ready.
