Hiring Team

Corelight

Corelight's foundation on Zeek and Suricata caught my attention immediately — I've spent the last several years building detection and analytics platforms directly on that same network telemetry, and I'd welcome the chance to bring that background to a team defining what's next for network detection.

At Shorepoint, I designed and built an entirely new security data platform for DOE/NNSA from the ground up: ingesting CrowdStrike, Suricata, and Zeek telemetry into a new Elasticsearch environment, then constructing the full analytics and detection layer on top of it — custom data transforms, a UEBA detection layer, custom dashboards, and data-quality monitoring and alerting. That project ran the full arc this role describes: proving out an idea, building it, and getting it into real use, with the same rapid-prototyping instinct Corelight is looking for.

I also bring hands-on GenAI/LLM experience applied specifically to security work: prompt engineering to analyze security data, identify false positives, and generate new detection content, plus using GenAI to interact directly with SIEM APIs for detection-content orchestration. I've built reusable GenAI-powered tooling for detection engineers — including automating the conversion of detection rules from one SIEM's rule syntax to another's — the kind of AI-for-both-software-and-security-work this role calls for.

That GenAI work sits on top of a deep detection-content engineering foundation: 2,300+ detection rules covering most of the MITRE ATT&CK matrix, a multi-SIEM detection-as-code pipeline orchestrating rule deployment across nine different platforms via their native APIs, and current work directly supporting Treasury's SOC through live incident response and threat hunting.

I'd welcome the opportunity to talk through how that background translates into Corelight's next generation of network security products.
