Senior Detection Engineer — MITRE ATT&CK, Multi-SIEM Detection-as-Code & Elasticsearch

Detection engineer with 12 years of experience building the detection content, data pipelines, and automation that find real threats at scale. Early hire at a next-gen SIEM startup (Cysiv, acquired by Trend Micro/Forescout) where I built the rules engine from scratch and created/managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix — signature, statistical, behavioral, and ML-based. Built a central Elasticsearch detection platform ingesting CrowdStrike (endpoint EDR), Suricata, and Zeek telemetry from the ground up, and run a multi-SIEM detection-as-code CI/CD pipeline with automated testing, rule-quality metrics, and staged/safe rollout — the same false-positive-reduction and pipeline-automation discipline this role's detection engineering responsibilities call for.

CORE SKILLS

Detection Engineering & MITRE ATT&CK: Signature, statistical, behavioral, aggregation/threshold, and ML-based detection content; 2,300+ rules covering most of the MITRE ATT&CK matrix; formal rule-quality metrics tracking (coverage, precision/false-positive rate) with staged/safe rollout before production

Endpoint & Enterprise Telemetry: Built a detection platform ingesting CrowdStrike (endpoint EDR), Suricata, and Zeek telemetry into a central Elasticsearch environment; UEBA (User and Entity Behavior Analytics) detection on top of custom data transforms; time-series anomaly detection on process chains and authentication behaviors

Multi-SIEM Detection-as-Code & Orchestration: Rule/content orchestration via native APIs across Microsoft Sentinel, Microsoft Defender, Google SecOps (Chronicle), Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, Devo, ArcSight; GitLab CI/CD pipeline with automated unit/integration tests and multithreaded parallel deployment

Elasticsearch: Query DSL, transforms, Logstash, multiple Beats variants, native ES detection rules/alerting, ES API, Kibana dashboarding — full-lifecycle detection content development, not just log shipping

AI/GenAI for Detection Engineering: Prompt engineering to analyze security data, identify false positives, and generate new detection content; GenAI-driven SIEM API orchestration across customers/platforms; built reusable GenAI-powered tooling to automate rule conversion between SIEM rule syntaxes

Engineering: Python, SQL, Git, GitLab CI/CD, PySpark/Dataproc/BigQuery/Dataflow

PROFESSIONAL EXPERIENCE

Senior Cybersecurity Engineer — Shorepoint

Oct 2023 – Present

- Currently create and manage detection/alerting analytics (Splunk saved searches) directly supporting a federal SOC's incident response and case work, tuning content for accuracy and coverage (Treasury SOC / TSSOC, current project).
- Built an entirely new detection platform from the ground up — CrowdStrike (endpoint EDR), Suricata, and Zeek telemetry into a central Elasticsearch environment — including a UEBA detection layer on custom data transforms, custom Kibana dashboards, and data-quality monitoring/alerting content (DOE/NNSA Security Data Integration project, completed).
- Supported data ingestion and data-quality efforts within an Elasticsearch/Splunk environment for a federal continuous-monitoring program (CISA CDM at DOE, completed).

Senior Threat Detection Engineer and Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of a data science and detection engineering team building signature, behavioral, statistical, and ML-based detection content against massive-scale customer telemetry on a cloud-based big-data platform, incorporating threat intel from Forescout's in-house Vedere Labs research team to tune detection logic.

Threat Detection Engineer and Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Very early hire at a next-gen cloud SIEM startup — built the detection rules engine from scratch and created/managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix, plus 50+ data filters, against 220+ ingested log sources.
- Built time-series anomaly detection for entity behaviors (process chains, authentication patterns) and ran exploratory data analysis at scale (GCP Dataproc, PySpark/SparkSQL) to develop new detection content; built a Common Information Model standardizing fields across all parsed data feeding the detection layer.

Security Data Scientist — Experian

Jan 2015 – Jan 2018

- Analyzed large-scale security log data to build custom detection models — DNS-based malware detection/mitigation and anomalous-behavior discovery across the network.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Hiring Team

Google — Enterprise Detection Engineering

I'm a detection engineer who has spent 12 years building the rules engines, data platforms, and automation pipelines that turn raw telemetry into high-fidelity detections — and I'm based in the Dallas/Ft. Worth area and ready to relocate to San Jose to do this work on-site.

As a very early hire at Cysiv (a next-gen cloud SIEM startup, later acquired by Trend Micro and Forescout), I built the detection rules engine from scratch and created and managed 2,300+ individual detection rules covering most of the MITRE ATT&CK matrix — signature, statistical, behavioral, and ML-based content, all developed and tuned against massive-scale customer telemetry. That work maps directly onto this role's core mandate: scoping detection requirements across enterprise surfaces and designing detection rules for systems with many interconnected components.

I've also built a central Elasticsearch detection platform from the ground up for a DOE/NNSA security program — ingesting CrowdStrike endpoint EDR, Suricata, and Zeek telemetry, then layering UEBA detection, custom dashboards, and data-quality alerting on top of it. And I run a multi-SIEM detection-as-code CI/CD pipeline in GitLab across Microsoft Sentinel, Microsoft Defender, Google SecOps, CrowdStrike, SentinelOne, and more — with automated testing, staged/safe rollout, and formally tracked rule-quality metrics (coverage, precision, false-positive rate) before anything reaches production. I've also applied GenAI directly to detection engineering — prompt-driven false-positive triage, new rule generation, and automated rule translation between SIEM syntaxes — relevant to this team's focus on defending against AI/agent threats at scale.

I'd welcome the chance to talk through how that background applies to securing Google's enterprise endpoint and SaaS footprint.
