Security Operations & Threat Management Hiring Team
6sense

Your team's mandate — protecting 6sense through prevention, detection, investigation, and response, while building the tools that let the team operate at speed and scale — maps directly onto how I've spent the last several years: building automation and detection infrastructure, not just running it.

At Trend Micro/Cysiv, I built a Python-based orchestration framework spanning nine SIEM and EDR platforms — Sentinel, Defender, Google SecOps, Splunk, CrowdStrike, SentinelOne, Sumo Logic, XSIAM, and Devo — with reusable adapters, API-level token/role management, and multithreaded parallel deployment, all running through a full GitLab CI/CD pipeline with automated tests and staged rollout. I created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix, and I've used that same ATT&CK fluency to inform investigations and anomaly detection, not just build a rule library.

I currently support Treasury's SOC directly against live incidents, and I build detection content informed by threat intel rather than reacting to it after the fact. I've also shipped production GenAI tooling for false-positive triage and automated rule generation — the same class of AI-powered automation your team is chartered to build.

I'd welcome the chance to talk through how that combination of multi-platform security automation, MITRE ATT&CK-based detection engineering, and live incident response fits 6sense's SecOps & Threats team.
