Senior Detection Engineer

Detection engineer with 8 years owning detection engineering programs end-to-end — threat modeling, detection design, deployment, and tuning — across nine SIEM/EDR platforms via a Python-based detection-as-code pipeline with full CI/CD, version control, and measured false-positive rates. Currently builds and tunes the Splunk-based detection content a live SOC's on-call responders trust and act on directly.

CORE SKILLS

Detection-as-Code & MITRE ATT&CK Coverage: Python-based detection-as-code orchestration across nine SIEM/EDR platforms via native APIs (Splunk, Microsoft Sentinel, Microsoft Defender, Google SecOps/Chronicle, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, Devo, plus prior ArcSight); full GitLab CI/CD with version control, automated unit/integration tests, and peer-reviewed staged rollout; 2,300+ detection rules created/managed covering most of the MITRE ATT&CK matrix, with coverage/precision/false-positive-rate tracked and tuned, not guessed

SIEM/EDR Pipeline Health & Telemetry: Data engineering for 220+ log sources feeding Splunk/Elasticsearch pipelines: 50+ Logstash filters, Elasticsearch Beats deployment, a Common Information Model standardizing schema across all parsed data, and connector/collector health monitoring so on-call responders can trust what pages them

Incident Support & Detection Tuning: Analytically supports a live SOC's (Treasury) case/incident queue end to end, building and tuning the Splunk detection and alerting content responders investigate against; knows the difference between a noisy rule and a broken one and tunes or retires detections before responders learn to ignore them

Threat Intel-Informed Investigation: Uses CTI (Vedere Labs and other sources) directly during alert triage and false-positive analysis to validate whether an alert reflects real adversary activity, and feeds that research back into detection logic — closing the loop from investigation to durable detection rather than one-off fixes

Automation & AI-Powered Tooling: Production Python automation for triage/enrichment and multithreaded parallel deployment of detection content across many environments; production GenAI tooling for false-positive triage and cross-platform detection-rule conversion, reducing manual triage load without proportional headcount

PROFESSIONAL EXPERIENCE

Senior Security Engineer — Shorepoint

Oct 2023 – Present

- Treasury SOC (TSSOC), Threat & Research team — team lead directing sprint priorities and technical direction for the Splunk-based detection and alerting content a live SOC runs incident investigations against; tunes rules on measured false-positive rate, not instinct.
- DOE/NNSA Security Data Integration (completed): built a new security data platform from scratch ingesting CrowdStrike, Suricata, and Zeek into Elasticsearch, plus the UEBA detection layer, custom dashboards, and data-quality monitoring/alerting on top — a ground-up build, not an inherited program.

Senior Threat Detection Engineer & Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of the detection engineering/data science team building cloud-based big-data detection content and infrastructure against massive customer telemetry; threat intel sourced from Vedere Labs, Forescout's in-house research team, directly informed detection tuning.

Threat Detection Engineer & Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Architected and built a Python-based detection-as-code orchestration framework across nine SIEM/EDR platforms via native APIs — reusable per-technology adapters for every interaction method (rule management, alerts, tables, schemas) — with multithreading to deploy detection content across many customers in parallel inside a full GitLab CI/CD pipeline, including automated unit/integration tests and staged rollout before full production deployment.
- Data engineering/pipelining for 220+ unique log data sources: 50+ Logstash filters, deployed Elasticsearch Beats for log collection, built a Common Information Model standardizing field names/types across all parsed data, and assisted building 'Loggify,' a homegrown log parsing/filtering tool that replaced Logstash.
- Built time-series anomaly detection on entity behavior (process chains, authentication patterns) to surface adversary activity existing signature-based rules missed, and built production GenAI tooling for detection-rule generation and cross-platform rule conversion.
- Created and managed API tokens, roles, and permissions across the nine SIEM platforms; created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Security Clearances: Top Secret (current, Treasury) · DOE Q Clearance · Public Trust (DOE)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Security & Corp IT Hiring Team
Fluidstack

Your posting asks for someone who owns a detection engineering program end to end — threat modeling, detection design, deployment, and tuning, with coverage mapped to MITRE ATT&CK and gaps documented rather than assumed away. That is precisely the shape of the work I've been doing for the last eight years.

At Trend Micro/Cysiv, I architected a Python-based detection-as-code framework spanning nine SIEM and EDR platforms — Splunk, Sentinel, Defender, Google SecOps, CrowdStrike, SentinelOne, Sumo Logic, XSIAM, and Devo — through a full GitLab CI/CD pipeline with version control, automated tests, and peer-reviewed staged rollout before anything shipped. I created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix, with coverage, precision, and false-positive rate tracked and tuned rather than guessed — the difference between a noisy rule and a broken one matters when responders have to trust what pages them.

I currently build and tune the Splunk detection content Treasury's SOC runs live incident investigations against, and before that built a security data platform from scratch at DOE/NNSA — ingesting CrowdStrike, Suricata, and Zeek into Elasticsearch and layering UEBA detection content on top with no inherited program to build from. Threat intel informs that tuning directly rather than sitting in a passive feed, and I've shipped production GenAI tooling that cuts manual triage load without adding headcount.

I'd welcome the chance to talk through how that combination of detection-as-code ownership, MITRE-mapped coverage, and hands-on SIEM/EDR pipeline health fits the detection engineering work ahead for Fluidstack's Security & Corp IT team.
