Staff Detection Engineer

Detection engineer who has built and run a detection engineering function end-to-end — telemetry to shipped detection to incident response — across cloud (AWS/GCP/Azure), endpoint, and identity sources. Built a Python-based detection-as-code orchestration framework spanning nine SIEM/EDR platforms with full CI/CD and staged rollout, and currently supports a live SOC's incident queue directly.

CORE SKILLS

Detection-as-Code & Coverage Ownership: Python-based detection-as-code orchestration across nine SIEM/EDR platforms via native APIs (Microsoft Sentinel, Microsoft Defender, Google SecOps/Chronicle, Splunk, CrowdStrike, SentinelOne, Sumo Logic, Palo Alto XSIAM, Devo, plus prior ArcSight); full GitLab CI/CD with automated unit/integration tests, version control, staged/safe rollout, and tracked coverage/precision/false-positive-rate metrics — detections shipped like software, never hand-edited in a console

Multi-Cloud & Endpoint Telemetry: Cloud security across AWS, GCP, and Azure (Sentinel/Defender API orchestration); data engineering for 220+ log sources including CrowdStrike, Suricata, and Zeek endpoint/network telemetry; built a Common Information Model standardizing schema across all parsed data; hands-on IAM and API token/role/permission management across nine SIEM platforms

Incident Response & Automation: Analytically supports a live SOC's case/incident queue (Treasury SOC) end to end; built UEBA detection content on top of a from-scratch security data platform (DOE/NNSA); multithreaded automation to deploy detection content across many customers/environments in parallel; production Python for triage/enrichment automation, not scripts spec'd for someone else to build

Threat Intel & Detection Tuning: Detection content directly informed by threat intel (Vedere Labs CTI) rather than passive feed consumption; alert enrichment with CTI context (actor attribution, known-bad indicators) to speed triage; time-series anomaly detection on entity behavior (process chains, authentication patterns) for investigation support

AI-Powered Security Tooling: Production GenAI tooling for false-positive triage and automated detection-content generation/cross-platform rule conversion; reusable GenAI-powered "skills" for detection engineers

PROFESSIONAL EXPERIENCE

Senior Security Engineer — Shorepoint

Oct 2023 – Present

- Treasury SOC (TSSOC), Threat & Research team — team lead directing sprint priorities and technical direction for the Splunk-based detection and alerting content a live SOC runs incident investigations against.
- DOE/NNSA Security Data Integration (completed): built a new security data platform from scratch ingesting CrowdStrike, Suricata, and Zeek into Elasticsearch, plus the UEBA detection layer, custom dashboards, and data-quality monitoring/alerting on top — a ground-up build, not an inherited program.

Senior Threat Detection Engineer & Data Scientist — Forescout

Aug 2022 – Oct 2023

- Senior member of the detection engineering/data science team building cloud-based big-data detection content and infrastructure against massive customer telemetry; threat intel sourced from Vedere Labs, Forescout's in-house research team, informed detection tuning.

Threat Detection Engineer & Data Scientist — Trend Micro / Cysiv

Sep 2018 – Aug 2022

- Architected and built a Python-based detection-as-code orchestration framework across nine SIEM/EDR platforms via native APIs — reusable per-technology adapters for every interaction method (rule management, alerts, tables, schemas) — with multithreading to deploy detection content across many customers in parallel inside a full GitLab CI/CD pipeline, including automated unit/integration tests and staged rollout before full production deployment.
- Data engineering/pipelining for 220+ unique log data sources: 50+ Logstash filters, deployed Elasticsearch Beats for log collection, built a Common Information Model standardizing field names/types across all parsed data, and assisted building 'Loggify,' a homegrown log parsing/filtering tool that replaced Logstash.
- Fetched large volumes of historical cold-storage data using a homegrown Apache Beam program run via GCP Dataflow; built production GenAI tooling for detection-rule generation and cross-platform rule conversion; time-series anomaly detection on entity behavior (process chains, authentication patterns) to support investigations.
- Created and managed API tokens, roles, and permissions across the nine SIEM platforms; created and managed 2,300+ detection rules covering most of the MITRE ATT&CK matrix.

EDUCATION & CERTIFICATIONS

M.S. Physics — University of North Texas (2013) | B.S. Physics — Ball State University (2011)

Security Clearances: Top Secret (current, Treasury) · DOE Q Clearance · Public Trust (DOE)

Splunk User Certification · Splunk for Analytics and Data Science · Johns Hopkins (Coursera): R Programming, The Data Scientist's Toolbox

Security & Corp IT Hiring Team
Fluidstack

Your posting asks for someone who has built a detection engineering function, not just operated inside one — telemetry pipelines, detection-as-code, and incident response, owned end to end. That is precisely the shape of the work I have been doing for the last several years.

At Trend Micro/Cysiv, I built a Python-based orchestration framework spanning nine SIEM and EDR platforms — Sentinel, Defender, Google SecOps, Splunk, CrowdStrike, SentinelOne, Sumo Logic, XSIAM, and Devo — with reusable per-technology adapters, API-level token/role management, and multithreaded parallel deployment, all running through a full GitLab CI/CD pipeline with automated tests and staged rollout before anything reached production. Underneath that sits telemetry engineering for 220+ log sources, including endpoint and network telemetry (CrowdStrike, Suricata, Zeek), and a Common Information Model standardizing schema across all of it — exactly the kind of foundation your team is building for a company whose attack surface spans corporate IT and gigawatt-scale infrastructure.

More recently, at DOE/NNSA, I built a security data platform from scratch — ingesting CrowdStrike, Suricata, and Zeek into a new Elasticsearch environment and layering UEBA detection content, dashboards, and data-quality monitoring on top, with no inherited program to build from. I currently support Treasury's SOC directly against live incidents, building detection content informed by threat intel rather than reacting to it after the fact, and I've shipped production GenAI tooling for triage automation and cross-platform rule conversion — the kind of force-multiplier your team can use without proportional headcount growth.

I'd welcome the chance to talk through how that combination of ground-up detection program building, multi-cloud telemetry engineering, and direct incident response experience fits Fluidstack's Security & Corp IT team.
